

Document 39. Diagram Speed-Drill Pack — Blind Sketch in 4 Minutes

Purpose. Diagrams are the highest-yield marks in H2 Economics. A fully-labelled diagram in a CSQ part typically earns 2–4 marks; in an essay, 3–5. This document is your drill book: cover the prompt, sketch the diagram in 4 minutes, then self-mark against the rubric.

Drill protocol. (1) Read the prompt only. (2) Time 4 minutes. (3) Sketch with pencil and ruler. (4) Self-mark against the rubric. (5) If $< 4/5$, re-attempt within 24 hrs. The aim is automaticity.

Section A. Diagram Rubric — The 5 Universal Mark Criteria

1. **Axes labelled** (variable + unit where relevant; e.g. P, Q; P, Y; r, AD/Y).
2. **All curves labelled** (DD, SS, MPC, MSC, AD, SRAS, LRAS, etc. *with subscripts* where shifted).
3. **Equilibrium points marked** (E_0 , E_1 , Q^* , etc.) and dashed lines to axes.
4. **Shaded welfare areas** (CS, PS, GovRev, DWL, externality wedge) clearly identified.
5. **Title** above the diagram, naming the scenario.

Every diagram in Section B is markable against this 5-criterion rubric. Aim: 5/5 in 4 minutes.

Section B. The 30 Diagrams to Master

#	Prompt	Key features to include
<i>Micro — Market Equilibrium</i>		
1	DD shift right (e.g. income up)	$DD_0 \rightarrow DD_1$; $E_0 \rightarrow E_1$; $P_1 > P_0$, $Q_1 > Q_0$
2	SS shift left (e.g. input cost up)	$SS_0 \rightarrow SS_1$; P up, Q down
3	Joint shift ($DD \uparrow$, $SS \downarrow$)	P unambiguously up; Q indeterminate (state which dominates)
4	Inelastic DD + tax (effect on P, Q)	Most burden on consumers; small Q fall; large GovRev rectangle
<i>Micro — Welfare & Intervention</i>		
5	Indirect tax welfare	SS shifts up by t ; CS loss, PS loss, GovRev, DWL triangle
6	Subsidy welfare	SS shifts down by s ; CS gain, PS gain, taxpayer cost, DWL
7	Price ceiling $< P_0$	Shortage, DWL triangle on left of Q_0
8	Price floor $> P_0$ (e.g. min wage)	Surplus, DWL, employer cost transfer
9	Quota $Q_{quota} < Q_0$	Vertical SS at Q_{quota} ; P rises; importer rent
<i>Micro — Market Failure</i>		
10	Negative production externality	MPC, MSC, MEC wedge, $Q_m > Q^*$, DWL right triangle
11	Negative consumption externality	MPB, MSB, MEC wedge below MPB, $Q_m > Q^*$
12	Positive production externality	MPC, MSC below MPC, $Q_m < Q^*$
13	Positive consumption externality	MPB, MSB above MPB (MEB wedge), $Q_m < Q^*$, under-consumption DWL
14	Pigouvian tax on negative externality	Tax = MEC at Q^* ; new equilibrium at Q^* ; welfare restored
15	Public good (free-rider)	Vertical-sum DD; missing market depiction or zero private provision
<i>Micro — Market Structures</i>		
16	Perfect competition long-run	$P=MR=MC=AC$ at min AC; normal profit; identical firm & industry diagrams
17	Monopoly profit-max	$P > MR=MC$; supernormal profit rectangle $(P-AC) \times Q$; DWL vs PC
18	Monopolistic competition long-run	$P > MC$; normal profit (tangency D & AC); excess capacity
19	Oligopoly kinked DD	Kink at P_0 ; MR discontinuity; price rigidity
<i>Macro — AD-AS</i>		
20	AD/AS with 3 regions of AS	Keynesian flat, intermediate, classical vertical; label Y_{FE}
21	Demand-pull inflation	$AD_1 \rightarrow AD_2$ on intermediate; P up, Y up
22	Cost-push inflation	$SRAS_1 \rightarrow SRAS_2$ leftward; P up, Y down (stagflation)
23	Multiplier process (AD shift)	$AD_1 \rightarrow AD_2$ by $k\Delta J$; gap between initial injection and final ΔY
24	Cyclical unemployment	$AD_2 \rightarrow AD_1$ leftward; $Y_a < Y^*$; output gap labelled
25	Actual vs potential growth	AD shift right (actual) vs LRAS shift right (potential); contrast
26	Sustained growth (AD + LRAS)	Both AD and LRAS shift right; P stable, Y rises
<i>Macro — External</i>		
27	Forex DD/SS (S\$ appreciation)	$DD_{S\$}$ right; $e_{S\$/US\$}$ up; quantity of S\$ exchanged up
28	MAS managed float band	Trend line for S\$NEER; $\pm$ band lines; arrow showing slope change
29	J-curve (post-depreciation)	CA on y-axis, time on x; dip then rise above original
30	Tariff welfare (small country)	World price + tariff; CS loss, PS gain, GovRev, two DWL triangles

Section C. Common Diagram Mistakes (Auto-fail Items)

1. Drawing AD as a straight line through three regions of AS but not labelling the regions.
2. Externality: drawing MSC parallel to MPC — this is wrong if MEC is not constant. State if assumed constant.
3. Tax: drawing the new SS curve above old by less than t at high Q — the shift is vertical, parallel.
4. Monopoly: shading profit as the rectangle from MR to MC rather than P to AC.
5. Tariff: forgetting that the tariff creates *two* DWL triangles (production + consumption distortion).
6. Forex: confusing the quantity axis (S\$ exchanged) with the price axis ($e = \text{S\$/US\$}$).
7. J-curve: drawing CA improving immediately rather than dipping first.
8. AD/AS: labelling LRAS as “AS” — always distinguish SRAS and LRAS.

Section D. 2-Minute Pre-Exam Diagram Warmup

On the morning of the exam, do these 4 sketches blind, in < 8 minutes total:

- (1) Negative production externality with Pigouvian tax.
- (2) AD/AS with cost-push shift.
- (3) Forex DD/SS for the S\$ with managed float band.
- (4) Tariff with full welfare-area decomposition.

If all 4 are $\geq 4/5$ against the rubric, your diagram automaticity is exam-ready.

Final principle. Diagrams are the single most under-prepared element of H2 Economics. A clean, fully-labelled diagram earns marks even when prose is weak. *Drill them until they are automatic.*
